

ala :1**SOLUTION:**

Line 6: Fix the condition in the `if` statement

- **Error:** `if car in car`
- **Fix:** `if car in cars`
- **Reason:** The program must check whether the entered car exists in the list `cars`, not inside the same variable.

Line 6: Add colon after the `if` statement

- **Error:** `if car in cars` (no colon)
- **Fix:** `if car in cars:`
- **Reason:** Python requires a colon `:` after `if` statements.

line 5: Convert input into integer

- **Error:** `days = input("Enter days: ")`
- **Fix:** Convert it to integer using `int()`
- **Reason:** `input()` returns text (string). Mathematical calculations need numbers.

Step 4: Add indentation inside the `if` block

- **Error:** No spaces before calculation lines
- **Fix:** Add 4 spaces before lines inside `if`
- **Reason:** Python uses indentation to define blocks of code.

Line 8: Add colon after `else`

- **Error:** `else` (no colon)
- **Fix:** `else:`
- **Reason:** Colon is required after `else`.

Line 14: Add colon after `for` loop

- **Error:** `for i in range(3)` (no colon)
- **Fix:** `for i in range(3):`
- **Reason:** Python requires colon after `for` statement.

Line 15: Add indentation inside `for` loop

- **Error:** `print("Thank you")` (no indentation)
- **Fix:** Add 4 spaces before print statement
- **Reason:** Code inside a loop must be indented.
